

MAIN SITE READINESS CHECKLIST

Ready to close *the old door?*

A step-by-step guide for proving the Replit site is ready before retiring the parallel Netlify copy.

The goal

Make sure families can find the site, referral sources can reach the team, and staff can use the tracker—before the older site is turned off.

Main site: eternallifehospice.com

Older copy: eternallifehospice.netlify.app

Prepared for: Eternal Life Hospice, Inc.

BEFORE YOU BEGIN

This is a go / no-go workbook

Walk through the phases in order. Put a check in the box only when you have personally verified the item. Write down where the proof lives so another person can repeat the check.

Stop if a critical item is red

Do not turn off Netlify if referrals fail, staff cannot use the tracker, the main domain is not reachable, or an important public page is broken.

● GREEN = proceed

Test passed and evidence recorded.

● RED = stop

Fix it, retest it, and record the result.

WHAT IS ALREADY KNOWN

- ☐ The Replit production deployment is public and has a successful build.
- ☐ The existing pre-deployment chain has passed.
- ☐ The tracker automated suite has passed.
- ☐ Live Google review data is returning without exposing the API key.

WHAT STILL NEEDS PROOF

- ☐ A real no-PHI referral test reaches both intended mailboxes.
- ☐ Staff can complete a production-style tracker workflow.
- ☐ No printed, email, social, or partner links still depend on Netlify.
- ☐ The site remains stable during an observation period.

Evidence / notes: Owner / date this walkthrough begins

Evidence / notes: Target date for Netlify freeze

MAP THE TWO SITES

Know what is connected

These are two separate deployments, but the old Netlify copy currently points some important requests to Replit. Record the facts before changing anything.

Check	What to verify	Result
☐ Main site	Open https://eternallifehospice.com in a private browser window.	☐ Green ☐ Red
☐ Replit deployment	Confirm the production deployment is public and the current build is successful.	☐ Green ☐ Red
☐ Old copy	Open https://eternallifehospice.netlify.app and note what still works there.	☐ Green ☐ Red
☐ Domain	Confirm the custom domain still opens the Replit site—not the Netlify copy.	☐ Green ☐ Red

Important connection to record

The Netlify copy has rules that forward `/tracker/*` and `/api/*` to Replit. Turning off Netlify will make those old Netlify addresses unavailable, but it will not shut down the same services on the main domain.

Check the release boundary

- ☐ Confirm the latest approved changes are present on the Replit production site.
- ☐ Run the complete pre-deployment chain before the final publish.
- ☐ Publish the approved build and verify the new production build is successful.
- ☐ Save the production URL and deployment date in the evidence below.

Evidence / notes: Production URL / build date / who verified it

Evidence / notes: Any difference found between the two copies

TEST THE PUBLIC WEBSITE

Walk through the front door

Use a private browser window and test on both desktop and phone. Click, scroll, submit, download, and return. A page that merely loads is not enough.

Pages and navigation

- ☐ Homepage opens and the hero, credentials, reviews, and contact actions appear.
- ☐ Desktop navigation opens every important section.
- ☐ Mobile menu opens, closes, and reaches the same pages.
- ☐ Services and care pages load without missing images or broken layout.
- ☐ Coverage and city pages load for representative cities in both counties.
- ☐ Search returns a useful result and a safe no-result state.

Resources and trust

- ☐ Family Guide opens and its download works.
- ☐ Media Kit opens and its download works.
- ☐ Journal index and at least one article open.
- ☐ Phone links open the phone app on mobile.
- ☐ Email links open the mail app with the correct address.
- ☐ Google Maps link opens the canonical listing.

Confirm the unavailable paths

Open [/events](#) and one retired Event detail URL. They should remain unavailable and should not reveal an old page.

Visual and technical pass

- ☐ No console errors on the key pages.
- ☐ No missing images, fonts, icons, or downloadable files.
- ☐ No horizontal overflow or clipped content on a phone.
- ☐ Cookie controls, chat, and accessibility labels behave normally.

Evidence / notes: Pages tested / devices used / problems found

TEST THE REFERRAL PATH

Make sure a message arrives

This is the most important test. Use a harmless test submission with no patient name, diagnosis, date of birth, address, or other protected information.

Never put PHI in a test

Use a clear test label such as "CUTOVER TEST — NO PATIENT INFORMATION." Delete the test messages after delivery has been confirmed.

1 Open the main referral page

Use the Replit production domain, not the development URL and not Netlify.

Evidence / notes: URL tested

2 Send one no-PHI test referral

Complete only the minimum fields needed to submit. Note the exact test time.

Evidence / notes: Time submitted / confirmation shown

3 Confirm provider acceptance

Verify the website shows a successful acceptance response and does not leave the sender guessing.

Evidence / notes: Acceptance result

4 Confirm both mailboxes receive it

Check the configured recipient and referral@eternallifehospice.com. Confirm the subject and contents are correct.

Evidence / notes: Mailbox / subject / received time

5 Confirm the sender reply

Check that the sender receives the intended confirmation and that it does not expose internal details.

Evidence / notes: Reply received / wording checked

6 Delete the test

Remove the test message from the mailboxes and any test records. Do not leave test data behind.

Evidence / notes: Deleted by / time

TEST STAFF TOOLS AND SERVICES

Make sure the team can work

OUTREACH TRACKER

Use a clearly labeled test office/visit record. Do not enter patient information.

- ☐ Log in successfully.
- ☐ Create a test visit.
- ☐ Edit the visit details.
- ☐ Change its status.
- ☐ Confirm a second office view sees the update.
- ☐ Export a CSV and open it.
- ☐ Delete the test record.
- ☐ Log out successfully.

Evidence / notes: Tracker test account / time / result

WEBSITE SERVICES

- ☐ Live Google reviews display correctly.
- ☐ Coverage lookup returns the expected result.
- ☐ Chat/help widget loads and gives a safe response.
- ☐ Phone and email actions point to the correct destinations.
- ☐ Google Business Profile link uses the canonical listing.
- ☐ Existing GA4 and Clarity coverage still loads.

Evidence / notes: Services tested / browser / result

Do not use GPS, maps, check-ins, or location tracking

The tracker is for outreach records and status updates only.

Data safety check

- ☐ No PHI checkbox is visible in the public tracker experience.
- ☐ Internal safety protections remain active.
- ☐ CSV export contains only the intended outreach fields.
- ☐ Test records were removed after verification.

Evidence / notes: Who performed the staff-tool test / cleanup confirmation

REMOVE HIDDEN DEPENDENCE

Make sure nobody is using the old address

Before Netlify is frozen, check the places that can quietly keep sending people to the old copy.

Public and printed links

- ☐ Email signatures
- ☐ Business cards
- ☐ Referral cards and PDFs
- ☐ QR codes
- ☐ Social profiles
- ☐ Google Business Profile
- ☐ Ads and campaign links
- ☐ Partner and directory listings

Search and technical links

- ☐ Search the repository for [netlify.app](#).
- ☐ Search the repository for old domains.
- ☐ Confirm canonical tags point to the main domain.
- ☐ Confirm sitemap and robots files use the main domain.
- ☐ Confirm social preview URLs use the main domain.
- ☐ Check browser bookmarks used by staff.

What happens when Netlify is turned off?

The old [netlify.app](#) address stops working. The main Replit site continues independently. Any old tracker or API URL using the Netlify address will also stop working, so replace those links first.

Observation period

- ☐ Freeze Netlify publishing—no new changes go there.
- ☐ Observe the Replit site for several days while Netlify remains available.
- ☐ Check referral delivery, tracker activity, error logs, and analytics each business day.
- ☐ Record every issue, even if it is fixed immediately.

Evidence / notes: Observation start / observation end / issues found

Evidence / notes: Final search or link audit completed by

FINAL DECISION

Freeze, retire, and watch

Do not delete the old copy as the first move. Freeze it, complete the final review, and keep a record of what was retired.

1 Freeze Netlify

Stop publishing new changes to the old copy. Keep it available during the final observation period.

2 Run the final smoke test

Recheck the main homepage, referral form, tracker, key downloads, phone/email actions, and unavailable Event paths.

3 Save the evidence

Keep this workbook, test timestamps, mailbox confirmation, link audit, and deployment information together.

4 Deactivate the old copy

Only after every critical item below is green. This affects the old Netlify address—not the main Replit site.

5 Monitor the main site after shutdown

Watch referrals, staff reports, logs, and analytics. If a problem appears, fix or roll back the Replit deployment; do not assume Netlify is the main site's backup.

GO / NO-GO SIGN-OFF

☐ Main domain works ☐ Referral path works ☐ Tracker works ☐ Links audited

☐ Observation period completed ☐ No unresolved critical issues

Decision: _____ Date: _____

Approved by: _____

Final rule

If you cannot prove it, leave Netlify frozen and available. A short delay is safer than a missed referral.
