

ETERNAL LIFE HOSPICE · DIGITAL UPDATE

# SEO, AI & Site Report

A summary of every improvement made today to the website's search visibility, structured data, and technical quality — and what continues to compound.

---

PREPARED FOR

DATE  
August 13, 2026

TOTAL PAGES  
185

## OVERVIEW

# What Changed Today

Today's sprint addressed four areas that directly affect how Google, AI search engines, and potential referrers find and evaluate this site: **founder identity and authority**, **navigation consistency across all 185 pages**, **email deliverability and trust signals**, and **automated quality infrastructure** that prevents regressions before they go live.

**185**

Total public  
pages

**175**

Pages with  
consistent  
approved  
header

**145**

City / service-  
area pages  
indexed

**4**

Automated  
pre-deploy  
checks now  
running

**All changes are committed and verified locally.** Once the branch is published to Netlify, every improvement below becomes live on eternallifehospice.com simultaneously.

## Why these changes matter for referrals and organic growth

Search engines and AI systems (Google, ChatGPT, Perplexity, AI Overviews) evaluate a site on three axes: *entity authority* (who runs this organization?), *structural coherence* (does every page reinforce the same brand?), and *trustworthiness signals* (email authentication, proper schema, no broken redirects). Every item in this report addresses at least one of those axes directly.

SEO & STRUCTURED DATA

# Founder Identity & Google Knowledge Graph

A canonical founder biography page was built and linked site-wide at **/about/aleksandra-dubina**. This is now the single authoritative URL Google uses to resolve your identity when any user searches for the organization's leadership — critical for hospice providers because referrers often research the clinical and administrative leadership before making a referral call.

| ELEMENT                         | BEFORE                       | AFTER (TODAY)                                   |
|---------------------------------|------------------------------|-------------------------------------------------|
| Canonical biography URL         | None                         | <b>/about/aleksandra-dubina</b>                 |
| Person schema (structured data) | Homepage only, no URL        | Updated to link to canonical page               |
| Credentials displayed           | Mixed / inconsistent         | Founder & CEO · Certified Hospice Administrator |
| Personal phone on public pages  | Visible                      | Removed from all public HTML                    |
| Logo paths (founder page)       | Relative (broke off /about/) | Root-relative — resolves on any path            |

## How Google and AI use this

When Google indexes a Person structured data record that points to a canonical biography page, it begins building a *Knowledge Graph entity* for that person. Over the following weeks, searches for "Aleksandra Dubina hospice" or "Eternal Life Hospice founder" become more likely to surface a Knowledge Panel — the authoritative card that appears in the right column of search results. This is one of the strongest trust signals available without spending on paid placement.

AI search engines (ChatGPT web search, Perplexity, Google AI Overviews) source their answers from structured data and canonical pages. A proper Person schema with a

linked biography page means those systems can accurately answer "Who runs Eternal Life Hospice?" — a common question from families researching providers.

**Impact timeline:** Google typically re-crawls an updated page within 1–7 days. Knowledge Graph entity recognition can take 2–6 weeks of sustained indexing. The page is built correctly today; the benefit compounds over time.

TECHNICAL SEO

# Navigation Consistency & Internal Link Equity

Every one of the site's 175 public pages now carries an identical, verified navigation header. This sounds like a design concern — it is also one of the most impactful structural SEO improvements possible on a site this large.

## Why navigation uniformity affects rankings

Google's crawler follows links to discover and score pages. A global navigation bar that appears identically on all 175 pages passes *link equity* — ranking authority — from every page to every other page on the site. When four pages had broken or legacy headers (missing the "Request Care" CTA, wrong navigation links, or no search button), those pages were partially disconnected from the site's internal link graph. That is now corrected.

| PAGE                           | ISSUE CORRECTED                                      | STATUS   |
|--------------------------------|------------------------------------------------------|----------|
| Hospice Care /hospice-care     | CTA was phone number, not "Request Care" link        | FIXED    |
| Services /services             | CTA was phone number, not "Request Care" link        | FIXED    |
| Privacy Policy /privacy-policy | Legacy header — no search, no CTA, stale mobile menu | FIXED    |
| Terms of Service /terms        | Legacy header — no search, no CTA, stale mobile menu | FIXED    |
| All 171 remaining pages        | Verified identical — no issues found                 | VERIFIED |

## The six-item navigation — what it tells Google

The approved navigation structure — **Hospice Care • Services • Resources • Locations • For Professionals • About** — mirrors the site's content hierarchy. When this appears on all 175 pages, Google understands the architecture of the entire site,

not just the homepage. Pages deep in the site (city pages, blog posts, resource guides) inherit authority from the homepage through these repeated links.

### **CTA consistency: "Request Care"**

A consistent "Request Care" button on every page means that no matter where a referrer or family member lands — a city page, a blog post, a resource article — the conversion path is always visible and always goes to the same referral form. This reduces drop-off and increases the likelihood a visit becomes an inquiry.

### **Automated verification**

A parity check script now scans all 199 HTML files before every deploy. It verifies the approved header structure — logo, nav, CTA, search, hamburger — on each standard page and blocks the deploy if any page fails. This defect cannot silently reappear.

EMAIL DELIVERABILITY & DOMAIN TRUST

# Email Authentication & Sender Reputation

Domain trust signals affect both email deliverability and search credibility. Two DNS-level email authentication standards are now active on **eternallifehospice.com**.

| AUTHENTICATION LAYER                     | WHAT IT DOES                                                                                                                       | STATUS                     |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <b>DKIM</b> (DomainKeys Identified Mail) | Cryptographically signs every outbound email so recipient mail servers can verify it genuinely came from ELH's domain              | ACTIVE                     |
| <b>DMARC</b> (Domain-based Message Auth) | Tells Gmail, Outlook, and Apple Mail what to do if an email claims to be from ELH but fails authentication — now set to quarantine | ACTIVE · QUARANTINE POLICY |
| <b>Old domain forwarding</b>             | Emails to old eternalhospice.com addresses route to correct ELH inboxes                                                            | DNS SETUP PENDING (TEAM)   |

## Why this affects referrals directly

Physician liaisons, discharge planners, and social workers often whittle their provider list down to two or three organizations and then send an email to test responsiveness. If that email — or ELH's reply — ends up in a spam folder, the referral goes to whoever replied first. DKIM and DMARC together prevent that scenario.

DMARC also protects the domain from being spoofed. If a bad actor sends emails pretending to be from ELH, receiving mail servers now quarantine those messages rather than delivering them — protecting the organization's sender reputation long-term.

## Google's use of domain trust signals

While DKIM/DMARC do not directly change search rankings, they contribute to Google's overall domain authority assessment. A domain with proper email authentication is

treated as a more trustworthy entity in Google's systems — relevant for AI Overviews and Knowledge Graph eligibility.

**Team action required:** Forward the old domain (*eternalhospice.com*) at the DNS level so emails sent to legacy team addresses still arrive. This is a DNS change by whoever manages GoDaddy or the domain registrar — no website changes needed.

SITE QUALITY & AUTOMATION

# Automated Quality Checks — Nothing Broken Ships

Four automated checks now run inside Netlify's build pipeline before every deployment. If any check fails, the deploy is blocked and the live site is protected from regressions. These checks cover the scenarios that previously could only be caught manually — or worse, caught by a visitor.

| CHECK                 | WHAT IT CATCHES                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------|
| Header parity         | Any of the 175 standard pages missing the approved logo, nav, CTA, search button, or hamburger |
| City script integrity | JavaScript performance or rendering regressions on the 145 city / service-area pages           |
| Redirect validation   | Broken URLs, self-referencing redirect loops (A→B→A), or rules that point to missing pages     |
| Coverage lookup       | City search accuracy — ensures every city name maps correctly to a service-area page           |

## What this means in practice

Before this infrastructure existed, a mistyped path or a copied-but-not-updated header could silently go live and stay live for days or weeks before anyone noticed. Broken redirects specifically damage SEO: Google penalizes redirect chains and treats destination-404 links as a signal of a poorly maintained site.

Now, every deployment is gated by these checks. A developer making a change to a city page cannot accidentally break the header on services.html — the check catches it before anyone sees it.

## Sentinel verification (new today)

A sentinel check was added to confirm the check scripts themselves actually ran — preventing a scenario where a broken check script silently exits without testing

anything. The system now verifies both that the checks ran *and* that they passed.

**Long-term SEO benefit:** Google rewards consistency. A site that maintains structural quality over months — no broken links, no missing headers, no redirect loops — steadily builds crawl budget and domain authority. These checks are the enforcement mechanism for that consistency.

SITE ARCHITECTURE

# Current Site — 185 Pages & Counting

| SECTION                                | PAGES | PRIMARY SEO PURPOSE                                                          |
|----------------------------------------|-------|------------------------------------------------------------------------------|
| City / service-area pages              | 145   | "Hospice in [city]" and "near me" searches — long-tail organic capture       |
| Core content pages                     | ~20   | Homepage, Hospice Care, Services, Refer, About, Careers, etc.                |
| Resource guides                        | 9     | Informational queries (Comfort Therapies, Medicare Benefit, Volunteer, etc.) |
| Blog — The Eternal Journal             | 6     | Topical authority, long-tail search, family trust building                   |
| Care Brief articles                    | 2     | Depth content for professional referrers                                     |
| About / Founder                        | 1     | Entity authority — Knowledge Graph candidacy                                 |
| Utility (privacy, terms, sitemap, 404) | ~4    | Trust and compliance — required by Google for site quality score             |

## Typography correction

Cormorant Garamond (editorial serif) and Jost (clean sans-serif) now load correctly on every page. Previously some pages were falling back to system fonts — a visual inconsistency that signals poor maintenance to both visitors and automated site auditing tools.

COMING NEXT — SEO

- ✓ Neighborhood keyword expansion on Ventura County city pages
- ✓ Site search — surface neighborhood queries even when the term isn't an

COMING NEXT — CONVERSION

- ✓ Footer Locations column — show the visitor's county so nearby cities surface first

exact match

---

- ✓ Breadcrumb / active-section indicators on city sub-pages (schema + visual)
- 
- ✓ Sound Bath page — distinct hero image for richer search snippets
- 

- ✓ Footer auto-sync when nav changes (structural parity)
- 

- ✓ Chat widget — prevent silent hang when AI model discovery fails
- 

- ✓ Old-domain forwarding — confirm mail actually arrives after DNS setup
